HW 4

Unit creation:

Each faction creates units to keep a balance of all types of units. This means that when creating units they will iteratively create units in this order: Rock, Scissors, Paper. If a unit dies in that faction, the next unit created will most likely be the same type unless multiple units die in the same turn.

Movement:

The AI has two factors to its decision to move the nearest enemy unit and the nearest enemy city. It prioritizes the nearest enemy unit within 3 spaces if it exists, otherwise will move toward the nearest enemy city. Both these find the linearly nearest enemy. Additionally, there is a 20% chance that the command will be overwritten, if there is not a nearest enemy unit, to a random movement for any unit. This additional randomness aids in preventing blockages and the wall of units for the last cities.

Further Improvements:

Including a check for diagonal enemies to prevent flip flopping until there is a good command stack to enable battle would increase the efficiency of the AI.
